Course code: PBIMC_DA

Is it up to you to prepare data for reporting? Do you already know how to connect data sources to Power BI? Are you looking for ways to do it quickly and effectively? Do you want to follow the standards and best practices, so you are sure the data is ready to be used by anyone in your organization? If so, we have prepared a unique Master Class training guaranteed by Štěpán Rešl (Microsoft Power BI MVP) on data analysis in Power BI with a focus on Power Query transformations. After finishing, you will be able to extract data from any source, including e-shops and public registers. You will be able to rapidly reduce the size of pbix files, dramatically speed up the data transformations or resolve any error message you come across. You will know how to set up data gateways, prepare and optimize data models so that users see only the content relevant to them. Calculated columns will become obsolete.
